Results for the final version of the firmware experiment with 768KB total, processed in 8KB chunks

For this experiment, the optimization level used for the speed analysis was -O3 (which generates the fastest code), and for the size it was -Oz (which generates the smallest code).

Below, we can see only the values needed to execute only the sha256 algorithm. (the vector declaration and initialization was subtracted from the final results – see the section *Raw Output*)

Note: All the commands used are listed in the section *Commands used*.

Cycle count

Difference: **480 cycles**

Without the function MatchSET1CLR1: **527,618,880**

With the function MatchSET1CLR1: **527,618,400**

Size

Difference:

text	data	bss	dec	hex
8	0	0	8	8

Without the function MatchSET1CLR1:

text	data	bss	dec	hex

1,996	288	128	2,412	96C

With the function MatchSET1CLR1:

text	data	bss	dec	hex
1,988	288	128	2,404	964

Raw output

Speed

- without the function MatchSET1CLR1:
